Day 1 Handouts:

1) Bloom’s taxonomy
2) Learning goal checklist
3) Course-scale goal slide
4) Tactics
5) Question Goals
Are your students learning the main concepts? Defining learning goals and assessing as you go.

Carl Wieman

Value of explicit learning goals:
1) better define and guide what you want to teach.
2) define for students what they should be learning (and why).
3) essential for measuring what students are learning -- to guide improvement of instruction
Plan of attack

Wk 1: Developing and using topic and lecture learning goals
   Developing questions to assess learning goals

Wk 2: More on assessing learning goals.
   Examining broader (course-scale) and longer term goals, better assessment through homework and exams

Have found no substitute for discussion with peers and iteration.
⇒ general and small group discussion and revisions.
Explicit learning goals

• **Basic definition:** What should students be able to do after completing course?
  *(How general attitudes or thinking are changed by course?)*

• **Requirement of a learning goal:** Must be measurable
  ⇒ assessment and goals tightly linked

• **Wide range of possible goals:**
  From memorizing terminology to
  → complex problem solving skills
  → transferring ideas to new contexts
  → thinking like a scientist *(including interest and see relevance)*
  *(Reflection of what you want students to learn and at what level)*
Syllabus/Topic list Vs. Learning Goals

Familiar
... good place to start

Syllabus/ Topic List
• Material covered (and time spent)

→ expand into learning goals.

Learning goals:
Outcome and student oriented:
• Identifies what students will be able to do as a result of learning
• Defines what students are expected to learn
From Syllabus/Topic list To Learning Goals

Familiar ... good place to start ... expand this into learning goals

Learning goals:
Course-scale learning goals
(~5 to 10 per course)

Topic-scale learning goals
(~2-5 per topic)

Lecture-scale learning goals
(~2-3 per class period)
(~learning objectives)

Consistency, Alignment
**Course-scale learning goals**
(5-10)

CONTENT

SKILLS

HABITS OF MIND

AFFECTIVE & BELIEFS

---

**Course-scale learning goals**
Recognize that the behavior of the world around you is not magical and mysterious, but rather can be understood and predicted using certain fundamental principles.

Understand the properties and motion of electric charges and use this knowledge to predict and explain various aspects of electricity.

---

**Lecture-scale learning goals**
Be able to design a fluorescent light bulb and to explain and justify the requirements on the various basic components.
Course-scale learning goals (5-10)

**CONTENT:** Be able to analyze, explain, and predict the motion of objects in the world around you

**SKILLS:** Cognitive/Process skills:
- Reasoning, Problem Solving, Evaluating, Critiquing...

Technical skills:
- Computer skills (debugging, software specific, ...)

**HABITS OF MIND:** Think like a ________:
- Use alternative representations; Compare and contrast; Reflect; Strategize, justify, and plan;

**AFFECTIVE:** Appreciate, Enjoy, Value,
- (e.g. Recognize that the behavior of the world around you is not magical and mysterious, but rather can be understood and predicted using certain fundamental principles.)

**BELIEFS:** About nature of learning and doing ________:
- (e.g. Believe that learning and doing physics is more about reasoning and making sense, not memorizing.)
Bloom's Taxonomy of the Cognitive Domain
(= content+skills+habits of mind)

1. Factual Knowledge: remember and recall factual information

2. Comprehension: demonstrate understanding of ideas, concepts

3. Application: apply comprehension to unfamiliar situations

4. Analysis: break down concepts into parts

5. Synthesis: transform, combine ideas to create something new

6. Evaluation: think critically about and defend a position
Bloom's Taxonomy of the Cognitive Domain
(~= content+skills+habits of mind)

1. Factual Knowledge: remember and recall factual information
   Define, List, State, Label, Name, Describe

2. Comprehension: demonstrate understanding of ideas, concepts
   Describe, Explain, Summarize, Interpret, Illustrate

3. Application: apply comprehension to unfamiliar situations
   Apply, Demonstrate, Use, Compute, Solve, Predict, Construct, Modify

4. Analysis: break down concepts into parts
   Compare, Contrast, Categorize, Distinguish, Identify, Infer

5. Synthesis: transform, combine ideas to create something new
   Develop, Create, Propose, Formulate, Design, Invent

6. Evaluation: think critically about and defend a position
   Judge, Appraise, Recommend, Justify, Defend, Criticize, Evaluate

Higher level: Require deeper conceptual understanding
Lecture-scale learning goals (2-3 per class period)
Example: Be able to design a fluorescent light bulb and to explain and justify the requirements on the various basic components.

Check-list for creating lecture-scale learning goals:
✓ Is goal expressed in terms of what the student will achieve? Does it identify what students will be able to do after the topic is covered?
✓ Is the Bloom’s level of the goal aligned with your expectations for students’ learning ... Is this what students will be able to do if they “understand” the topic at the level you want?
  ✓ If you expect reasoning for “why”, does it convey that?
  ✓ Could you expect a higher level goal?
✓ Is it well-defined? Is it clear how you would test achievement?
✓ Do chosen verbs have a clear meaning?
✓ Is terminology familiar/common? If not, is the terminology a goal?

Not every goal can achieve the following, but if you can express it to address these, that is better:
✓ Is it relevant and useful to students? (e.g. connected to their everyday life, or does it represent a useful application of the ideas).
### Introduction to Molecular and Cell Biology

<table>
<thead>
<tr>
<th>Original L.G.</th>
<th>Problems</th>
</tr>
</thead>
<tbody>
<tr>
<td>Describe how the process of extracting information from genetic material is regulated at each step of conversion of DNA to RNA to protein.</td>
<td>Low level goal—explicitly encourages students to memorize the steps from DNA to protein</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>New L.G.</th>
<th>Advantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Propose two different ways that an abnormal protein could be made in a cell, resulting in disease symptoms.</td>
<td>Higher level goal—encourages student to think about how proteins work, how they are produced, and how they can be altered by mutations in DNA.</td>
</tr>
</tbody>
</table>
What level is this and do you have suggestions for improving?

- You should know how to apply Ohm’s Law, and be able to calculate V, I, and R for various circuit configurations.
Levels of learning goals

Topic = Provincial Government/Democracy

• With partner write two specific learning goals:
  – 1 learning goal at Blooms Level (1 or 2) and decide what level it is.
  – 1 learning goal at Blooms Level (3-6) and decide what level it is.

Goals:
To be able to use Bloom’s taxonomy to help craft and to identify learning goals at various cognitive levels.
To be able to debate the limitations of relying solely on the verb to define the level.
Next Activity:
Work on your learning goals with your table group

• Share with each other some of the learning goals (LG) that you have for a class that you teach.

• Pick one that you feel could be improved.

• Use your white boards to work on revising the LG.
  – Compare the current wording of the LG to the guidelines we have provided (identify the “level” of this LG, and whether it is too broad or too narrow).
  – Discuss how the LG could be rewritten to better state your true goal.
Testing achievement of learning goals:

- Formative assessment (Know what students think now (before exam), and fix it!)

- By what methods could you ask a question on one of your lecture-scale learning goals, collect answers, and evaluate it?
Each question sends a message to the students:

3 areas to consider when developing a question

1. **Content Goal**: Does the question test an essential aspect of the material?

2. **Cognitive Goal**: How do students use the content to arrive at the answer? What does it mean to learn or “do” this subject?

3. **Metacognitive Goal**: Are students examining their own thinking?
The Montillation of Traxoline
when assessment goes astray

It is very important that you learn about traxoline. Traxoline is a new form of zionter. It is montilled in Ceristanna. The Ceristannians gristerlate large quantities of fevon and then bracter it to quasel traxoline. Traxoline may well be one of our most lukized snezlaus in the future, because of our zionter lescelidge.

---

Assessment of Understanding

Answer these questions in complete sentences. Be sure to use your best handwriting.

1. What is traxoline?
2. Where is traxoline montilled?
3. How is traxoline quaselled?
4. Why is it important to know about traxoline?

[attributed to Judy Lanier]
Each question sends a message to the students:

3 areas to consider when developing a question

1. **Content Goal:** Does the question test an essential aspect of the material? Is it aligned with your learning goal?

   Defines students focus … what they think your goals are.

2. **Cognitive Goal:** How do students use the content to arrive at the answer? What does it mean to learn or “do” this subject? What are the cognitive processes involved? Are they comparing and contrasting phenomena, ranking, classifying, or performing a mathematical manipulation?

3. **Metacognitive Goal:** Are students examining their own thinking?

   Hidden/implicit
Small (table) group activity:

1) Write a question to test learning of one of your goals. What are goals of your question? (content, cognitive, metacognitive).

Follow-up discussion of process and of question design.

Strategies for avoiding memorization:

“Troubleshooting”

something changes, what could cause this?

“redesign”

“compare and contrast” scenarios
How would implement your question in class? (logistics)
Ideas for implementation:

- Ask question in exam or homework.
- Ask students to write answer to a question on a sheet of paper and turn it in.
- Ask students to write answer on own, then discuss with others, then write a revised answer.
- Ask students to discuss question in groups, write a group answer.
- Ask a multiple choice question and ask students to vote using their hands, colored cards, or clickers.
- Students can answer on their own or discuss in groups.
- Give credit for answering questions but don’t grade.

Clickers, Colored Cards
One Minute Papers (individual or group)
Pretest - Posttest
End day 1.

**Homework**

1. Read article by Beatty et al. on “Designing effective questions for classroom …”

2. Develop 3 or 4 course level goals for a course you have taught or expect to teach soon.
Day 2 HANDOUTS

- Exercise sheet with course/class activities and with example on the back
- FCI content survey
- CLASS survey
- Examples from Chemistry & Biology
Important questions from first session.

1. **Goals that can’t be measured?**
   Course level goals often too broad to measure directly. Clarified and defined by detailed goals that are measurable. *(If still not measurable, declare attained. 😊)*

2. **Goals too specific, limit contexts of application?**
   Goal quite specific for given context, but then added goal is “Be able to apply to range of contexts.” *(With range of interest defined.)*

3. If goals are specific, won’t they just memorize material?
   Probably not as much as if goals not specifically state involve things beyond memorization.
   b. Not as easy as might think if use higher level thinking verbs/questions/activities. *(think Montillation of Traxoline)*

   `alignment-- lecture, homework, exams`
Day 2

Standard experiences from in-class formative assessment--
"Oh my god! I never imagined they were thinking that/
did not know that/would start asking so many questions
about, ..."

I. More on question development.
   • Question design tactics - Beatty et al
     Different representations

II. Course level learning goals.

III. Some standard course level assessment tools.
    Creating assessment tools.
Question Development:
One question can address multiple types of goals

1. **Content Goal:** Does the question test an essential aspect of the material? Is it aligned with your learning goal?

2. **Cognitive Goal:** How do students use the content to arrive at the answer? What does it mean to learn or “do” this subject? What are the cognitive processes involved? Are they comparing and contrasting phenomena, ranking, classifying, or performing a mathematical manipulation?

3. **Metacognitive Goal:** Are students examining their own thinking?
Question Design Tactics (from Beatty Article)

**Tactics for directing attention and raising awareness:**
- Remove nonessentials
- Compare and contrast
- Extend the context
- Reuse familiar question situations
- Oops-go-back

**Tactics for stimulating cognitive processes:**
- Interpret representations
- Compare and contrast
- Extend the context
- Identify a set or subset
- Rank variants
- Reveal a better way
- Strategize only
- Include extraneous information
- Omit necessary information

**Tactics for formative use of response data:**
- Answer choices reveal likely difficulties
- Use “none of the above”

**Tactics for promoting articulation discussion:**
- Qualitative questions
- Analysis and reasoning questions
- Multiple defensible answers
- Require unstated assumptions
- Trap unjustified assumptions
- Deliberate ambiguity
- Trolling for misconceptions
Tactics for Questions (Beatty, 2005)

1. Remove inessential details to focus students’ attention where you want it.

2. Have students compare two things. Their attention will naturally be drawn to the differences between them.

3. Ask a familiar question about an unfamiliar situation to draw students’ attention to the ways the new situation differs from a familiar one.

4. Ask a series of two questions. The first is a trap intended to make students commit a common error. Before reviewing the first question, ask a second which makes them aware of the error they have just committed. This technique can help them discover the mistake they made.
5. Require students to use different representations. Ask them to explain in words the meaning of a mathematical formula. Ask them to use information from a graph in a mathematical formula. Ask them to graph data in a table.

6. Present students with a set of processes or objects and ask them to determine subsets within the items presented.

7. Direct the strategy to force students to use more than one method. If students commonly solve a type of problem one way, require that they use a different method.

8. Include extraneous information or omit necessary information so that students think more carefully about what they need to solve the problem. If they are always provided with only the information needed, an important part of the problem solving has been done for them. “Not enough information is given” can be the correct answer for some questions.
Ex: Revising a Chemistry Question to use representations

If you start with 6 S atoms and 6 O\textsubscript{2} molecules, how many SO\textsubscript{3} molecules can you form given the following reaction?

\[ 2S + 3 O_2 \rightarrow 2 SO_3 \]

A. 2  
B. 3  
C. 4  
D. 5  
E. 6
This diagram represents a mixture of S atoms and O₂ molecules in a closed container.

Which diagram shows the results after the mixture reacts as completely as possible according to the equation

$$2S + 3 O_2 \rightarrow 2 SO_3$$

A. B. C. D. E.
Calculate currents and voltages at points A and B, when:
(1) B is connected to C
(2) B not connected to C

What happens to the brightness of the 3 identical bulbs when switch is closed?
Concept maps.
Evolution

**Concepts:**
- Survival of the fittest
- Genetic code
- Mutations
- Speciation
- Diversity
- Reproduction
- Isolation
- Differentiation
- Advantage
- Disadvantage
- Environmental conditions
- Protection

Draw a map inserting terms that link these concepts.

- Mutations lead to Differentiation
- Can be Advantage
- Can be Disadvantage
- Determine if Environmental conditions
5. Require students to use different representations. Ask them to explain in words the meaning of a mathematical formula. Ask them to use information from a graph in a mathematical formula. Ask them to graph data in a table.

6. Present students with a set of processes or objects and ask them to determine subsets within the items presented.

7. Direct the strategy to force students to use more than one method. If students commonly solve a type of problem one way, require that they use a different method.

8. Include extraneous information or omit necessary information so that students think more carefully about what they need to solve the problem. If they are always provided with only the information needed, an important part of the problem solving has been done for them. “Not enough information is given” can be the correct answer for some questions.
Work in pairs to write new question(s) using one or more of tactics.

Think about 3 areas: content, cognitive, metacognitive.

Share question.
• what tactics used?
• what is question testing?
• what messages are being sent about what you value students to learn & about the discipline?
Course level learning goals
Some examples of goals

• Share some of your course-scale learning goals
• What did you think about as you wrote these goals?
• Does assessing these goals seem problematic?

CONTENT  HABITS OF MIND
SKILLS  AFFECTIVE  BELIEFS
How do you structure a course to develop and target these goals?

• Some ideas!
Developing course-scale learning goals: An example from Modern Physics

- Goal: Apply knowledge of behavior of atoms and light to novel applications.
- Lecture: Structure of atoms, interaction with light, discharge lamps – students learn basic physics.
- Homework: apply knowledge of atoms and light to photomultiplier tubes and digital cameras.
- Exam Question: “Explain what would have to happen (in your example atom) for the electron in the atom to become free (unbound from the atom). Draw a diagram of a discharge lamp set-up, showing the voltage supplied by the battery and the location of the gas molecules where this would be a possible outcome. Explain your reasoning.”
<table>
<thead>
<tr>
<th>Course-scale goal:</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Course activities:</th>
<th>Connected lecture or topic – scale learning goals:</th>

</tr>
<tr>
<td>Exam:</td>
<td></td>
</tr>
<tr>
<td>Other:</td>
<td></td>
</tr>
</tbody>
</table>
**Course-scale goal:** Apply knowledge of behavior of atoms and light to novel applications.

<table>
<thead>
<tr>
<th>Course activities:</th>
<th>Connected lecture or topic – scale learning goals:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>In class:</strong> Structure of atoms, interaction with light, discharge lamps - students learn basic physics. (Use clicker questions, student discussion)</td>
<td>e.g. Be able to propose various strategies for redesigning the semi-conductor used in a digital camera detector to control the color of light it would detect and explain why these changes would lead to a change in behavior.</td>
</tr>
<tr>
<td><strong>HW:</strong> Apply knowledge of atoms and light to photomultiplier tubes and digital cameras. (Make students explain reasoning, draw connections between ideas and actual behavior and outcomes (e.g. the digital pictures), use multiple representations)</td>
<td></td>
</tr>
<tr>
<td><strong>Exam:</strong> “Explain what would have to happen (in your example atom) for the electron in the atom to become free (unbound from the atom). Draw a diagram of a discharge lamp set-up, showing the voltage supplied by the battery and the location of the gas molecules where this would be a possible outcome. Explain your reasoning.”</td>
<td></td>
</tr>
</tbody>
</table>
• Work in pairs to examine how in your course you would address course-scale goal and how this is connected to lecture-scale goals.

• Share examples with the whole group
Examples for assessing course level goals
Measuring learning gains: Pre-post content surveys

Force Concept Inventory (FCI)
- Multiple choice conceptual content survey
- Given pre-post

Usefulness of Pre-post survey:
1) Pre-test:
   - know students initial ideas
   - establish baseline understanding

2) Pre-post:
   - measure learning gain
     - for individual students, or class average

\[
\text{Normalized gain} \ < \ g \ >= \ \frac{\text{post} - \text{pre}}{100 - \text{pre}}
\]

- measure effect of year-to-year modifications in course
Creating pre-post content surveys

**Basics:**
1) Decide which specific learning goals to test (can’t test them all in a ~30 min survey)

2) Formats: open-ended or multiple-choice or combo

3) * Multiple questions per concept/idea  
   - can they use idea in different contexts  
   * Distracters that represent common student misconceptions or problem solving difficulties

**Validation (student and faculty interviews):**
Are questions interpreted consistently by students/faculty? Is wording clear?  
Are questions accurately capturing true misconceptions or true understanding of the concept/idea?

Time consuming
Other ways to measure learning gains

- Repeat challenging questions from semester to semester.
- Compare student performance
- Assess how students’ answers change as you change the way you teach the class

problem set questions
exam questions
final exam questions

Can all be used to collect this kind of feedback
Measuring learning gains

**Pre-post content surveys:**

Force Concept Inventory (FCI)
- Multiple choice conceptual content survey
- From Pre/post results, calculate learning gain

\[
\text{Normalized gain } < g > = \frac{\text{post} - \text{pre}}{100 - \text{pre}}
\]

![Graph showing fraction of unknown basic concepts learned](image)

Traditional Lecture (14 classes)

48 classes
(Various approaches to increase active thinking)

Fraction of unknown basic concepts learned

R. Hake, "...A six-thousand-student survey..." AJP 66, 64-74 (‘98).
Measuring learning gains

**Pre-post content surveys:**
- Force Concept Inventory (FCI)
  - Multiple choice conceptual content survey
  - From Pre/post results, calculate learning gain

**Using pre-post surveys:**
- Maintaining integrity of the survey is key.
- Not administered as an exam (credit for participation but not graded)
- Establishing incentives for students to put in effort (use as a review for exam)
Parallels from physics to biology
Normalized average learning gains
from three semesters of Developmental Biology
taught by the same 2 instructors
with same syllabus

<table>
<thead>
<tr>
<th></th>
<th>Traditional F’03</th>
<th>Interactive S’04</th>
<th>Interactive S’05</th>

9) Examples from Chemistry & Biology (not in PP file)
Various types of course-scale learning goals (5-10)

**CONTENT:** Be able to analyze, explain, and predict the motion of objects in the world around you

**SKILLS:** Cognitive/Process skills:
- Reasoning, Problem Solving, Evaluating, Critiquing...
Technical skills:
- Computer skills (debugging, software specific, …)

**HABITS OF MIND:** Think like a ________:
- Use alternative representations; Compare and contrast; Reflect; Strategize, justify, and plan;

**AFFECTIVE:** Appreciate, Enjoy, Value,
(e.g. Recognize that the behavior of the world around you is not magical and mysterious, but rather can be understood and predicted using certain fundamental principles.)

**BELIEFS:** About nature of learning and doing ________:
(e.g. Believe that learning and doing physics is more about reasoning and making sense, not memorizing.)
Guidance for creating lecture-scale learning goals:

- Is goal expressed in terms of what the student will achieve? Does it identify what students will be able to do after the topic is covered?

- Is the Bloom’s level of the goal aligned with your expectations for students’ learning … Is this what students will be able to do if they “understand” the topic at the level you want?
  - If you expect reasoning for “why”, does it convey that?
  - Could you expect a higher level goal?

- Is it well-defined? Is it clear how you would test achievement?

- Do chosen verbs have a clear meaning?

- Is terminology familiar/common? If not, is the terminology a goal?

Not every goal can achieve the following, but if you can express it to address this, that is better:

- Is it relevant and useful to students? (e.g. connected to their everyday life OR does it represent a useful application of the ideas).
Bloom's Taxonomy of the Cognitive Domain
(Levels of Learning)

1. Factual Knowledge: remember and recall factual information
   Define, List, State, Label, Name, Describe

2. Comprehension: demonstrate understanding of ideas, concepts
   Describe, Explain, Summarize, Interpret, Illustrate

3. Application: apply comprehension to unfamiliar situations
   Apply, Demonstrate, Use, Compute, Solve, Predict, Construct, Modify

4. Analysis: break down concepts into parts
   Compare, Contrast, Categorize, Distinguish, Identify, Infer

5. Synthesis: transform, combine ideas to create something new
   Develop, Create, Propose, Formulate, Design, Invent

6. Evaluation: think critically about and defend a position
   Judge, Appraise, Recommend, Justify, Defend, Criticize, Evaluate

Higher level: Require deeper conceptual understanding
Question Development:
One question can address multiple types of goals

1. **Content Goal:** Does the question test an essential aspect of the material? Is it aligned with your learning goal?

2. **Cognitive Goal:** How do students use the content to arrive at the answer? What does it mean to learn or “do” this subject? What are the cognitive processes involved? Are they comparing and contrasting phenomena, ranking, classifying, or performing a mathematical manipulation?

3. **Metacognitive Goal:** Are students examining their own thinking?

What level are these and do you have suggestions for improving them?

• You should know how to apply Ohm’s Law, and be able to calculate V, I, and R for various elements in a variety of circuit configurations.

• Students will be able to define the terms passive diffusion, facilitated diffusion, and active transport based on cellular energy requirements.
